

Safer Crossings Now

A practical package for reducing severe pedestrian injuries on high-risk corridors

A small set of proven street changes can reduce exposure and vehicle speed within one budget cycle. The brief recommends focusing on the 18 intersections responsible for the highest share of severe crashes.

FIRST PHASE

Problem

Long crossing distances, permissive turns, and inconsistent lighting concentrate risk at predictable sites.

Policy package

Use daylighting, leading pedestrian intervals, median refuges, and hardened centerlines together.

Accountability

Publish monthly installation progress and quarterly speed and injury indicators by corridor.
